## INTRODUCTION

This is an electronic game that makes extensive use of digital integrated circuitry and television monitor circuitry. This manual assumes the maintenance technician possesses a general knowledge of solid state circuitry, microprocessor, TTL digital integrated circuitry and T.V. monitor concepts. Any individual NOT knowledgeable in these areas SHOULD NOT attempt repair of the electronic portion of this game. IT SHOULD BE NOTED THAT ANY ATTEMPT TO REPAIR THE GAME IN THE FIELD WITHOUT EXPRESS CONSENT OF THE FACTORY WILL IMMEDIATELY VOID THE WARRANTY!!!

### IMPORTANT NOTES:

- NEVER replace any components with anything other than exact replacement parts. (See Parts List located on Service Schematics.
  - NEVER remove circuit boards/connections while power is on.
  - DO NOT replace the fuse with anything other than the proper value. A blown fuse indicates an overload condition within the game. Replacing the fuse with a higher value can cause severe damage to internal components if an overload occurs.
  - ALWAYS consult the manual before attempting repairs.
- CORRESPONDENCE regarding this game should be addressed to:

GREMLIN INDUSTRIES, INC.

8401 Aero Drive

San Diego, California 92123

(714) 277-8700

### IMPORTANT NOTE

An important service note is posted in this game and is repeated here for emphasis:

IF AT ANY TIME THE T. V. SCREEN SHOWS A MEANINGLESS DISPLAY  
OR THE GAME OTHERWISE MALFUNCTIONS, SIMPLY DROP A COIN INTO  
THE COIN MECHANISM. THIS SHOULD CORRECT THE PROBLEM. IF  
NOT, THE GAME REQUIRES SERVICE.

The circuitry in this game has been arranged so that the insertion of a quarter through the coin mechanism will reset the system. This clears up temporary problems caused by power line disturbances, static, etc.

#### SERVICE TECHNICIAN NOTE:

The system reset circuitry described above requires that the coin counter is attached to the system. If there is a coin counter problem and no replacement is available, the game will function properly if a 10K 0hm resistor is connected across the coin counter input pins to the video logic board.

## REPACKAGING INSTRUCTIONS

Should it be necessary to ship this game, follow the instructions below for game recrating:

- A) If the original shipping bolts have been discarded (Ref.1), obtain four 5/16-18x1 3/4" hex head bolts with 5/16" flat washers. Carefully lay the game on its side and attach skid (Ref.2).
- B) Place game upright. Tape game keys to upper flange of operator's panel (Ref.3). Crate the game using appropriate shock-absorbent packing material (Ref.4). Include padding on all four corners of the game (Ref.5). After crating is completed, secure package with strapping (Ref.6).

NOTE: If the game is to be shipped to GREMLIN for service or repair, attach a tag identifying the distributor and indicate the service or repair to be made; include the full serial number of the game. GAME MUST BE SHIPPED PREPAID.

## GAME CONCEPT - HEAD ON

HEAD ON is a single-player video driving game. A player steers his car around the screen track, gaining as many points as possible in the time allotted. By maneuvering his car through the lanes, the player erases the markers in each lane for high score. But, the game has an additional element of challenge- the computer's car. It also moves around the track, in the opposite direction, and presents a test of skill by challenging the player to outsmart its moves and avoid a crash.

Both the player's car and the computer's car (it's the hollow one) start at the bottom of the screen. As the player moves his car around the track, he clears the lane markers and adds points to his score. He must judge which lane to stay in or move to, depending on where the computer's car is. With the control panel joystick and accelerator button, the player controls not only his car's speed, either fast or slow, but also the number of lane changes he can make. For example, the player sees he can avoid the other car by making a lane change. Depending on how fast he is moving, the player can maneuver his car to change one or two lanes. If the car is moving fast, the player can make only one lane change; at slow speed, two lane changes are possible. Play continues in this manner, with the player continually trying to predict where the computer car will go, so that the two cars won't crash. If they do, the game resets the cars to the starting line and the lane markers reappear. The player again tries to clear as many lane markers as possible before time runs out. While game time is 90 seconds, play continues after that time to allow the player a last chance to clear any remaining lane markers. If he does this, the game gives a bonus time of 30 seconds. If he crashes, the game ends. The bonus time is awarded any time the player clears all the lane markers without crashing.

Each lane is given a point value, as shown in the track infield. At game start, each lane is worth 5 points. This value increases by 5 points each time the player clears all the lane markers. Also, the three highest scores to date are displayed on the track infield.

## GAME CONCEPT cont'd.

As mentioned above, the computer's car adds challenge to the game action. At first, the player may have no difficulty avoiding the computer's car; but, as the game progresses, and the player's score increases, predicting which way the computer car will go becomes harder. This feature allows for a variety of player skill levels.

HEAD ON is played with two controls- a joystick and push button. The joystick allows the player to make a lane change up, down, or left or right, depending on which part of the track his car is located. The push button controls the speed: Push down to move the car faster; release it to slow the car down.

HEAD ON has a complete set of sounds to highlight the action. Each car has its own engine sound; both the player's car and computer's car have different sounds for fast and slow speeds. Also, both cars produce a screech sound at each corner of the track, and when changing lanes. A sensational explosion occurs whenever the cars collide.

There are two options in HEAD ON: The number of coins per game (1,2,3,or 4) and, sound off during advertising. To select 2, 3, or 4 coins per game (the game is shipped in the 1 coin per game mode) a jumper is connected from ground (pin 10 on the player control connector on the logic board) to pin 3 for 2 coins per game, or to pin 4 for 3 coins. Both pins 2 and 3 are grounded for 4 coins per game. To turn off the advertising sound, simply turn the sound switch, located inside the coin door, to "OFF".

MAINTENANCE PROCEDURES- HEAD ON

I. POWER SUPPLY (refer to drawing #815-0020, sheet 4)

1. Remove output connectors from power supply.
2. Make these initial tests: (GND to BLACK lead on c18, 9000 mfd capacitor)
  - a) +9 V DC on POSITIVE terminal of C18
  - b) +17-19 V on C6 (4700 mfd. cap.)
  - c) -17-19 V on C5 (4700 mfd. cap.)
  - d) -12 V at pin 11 (adjustable by trim pot R42)
  - e) +12 V at pin 12 (adjustable by trim pot R8 )
  - f) +5 V at pins 18-20 (adjustable by trim pot R9)
  - g) GND (ground, 0 V) at pins 14-16
  - h) 2-3 V AC at pin 13 (Don't forget to change meter scale to AC)
3. Check these voltages again with the logic board connected. If any are wrong, a loading problem exists in the logic board, most likely.  
Possible causes of a short on the logic board could be: U73, C21, C25, or C26.

II. SOUND BOARD (refer to drawing #822-0002, sheet 6)

1. If no sounds are produced:
  - a) check connections between logic board (labelled "Sound Out") and Sound board (pins 1 through 14) and between the Sound board and the Power Supply.
  - b) If they are good, check IC U16 on the logic board, pins 2,5,6,9,12, 15,16,and 19 for outputs when each sound is produced.
  - c) If the outputs are present, check the output of the sound board, pin 5. If the signals are present here (use an oscilloscope for best results) check the amplifier circuit on the power supply, specifically, U4, Q8, and Q9.

2. If some sounds are produced, but not all:

a) repeat steps a and b, above.

b) If these prove OK, check the specific circuit for each sound:

SOUND TYPE:	SOUND BOARD PIN #:	CHECK THESE PARTS:
Crash	Pin 1	Q2, U2, U1, U13
High Speed (computer car)	Pin 2	Q8, U9, U8, U7
Car on	Pin 3	Q9, Q6, U9, U12, Q10, U6, U5

MAINTENANCE PROCEDURES- cont'd.

High Speed (player car)	Pin 4	Q12, Q10, U12, U6, U5
Screech #1	Pin 6	Q14, U10, D7
Screech #2	Pin 7	Q13, U10, D6
Bonus	Pin 8	Q5, U4, U10, D8, C19

III. LOGIC BOARD (refer to drawing #822-0001, sheets 4,5, and 6)

1. Game does not reset at power on: (see sheet 5)
  - a) check connector pin 3 on logic board for 3 V AC signal. Also, check Q10, Q11, U55, U54, and U71.
2. No video: (see sheet 5)
  - a) check U48 (part #315-0042) for video signals. Also, check U41, Q6 and Q7 for the video signals.
3. Game does not coin: (see sheet 5)
  - a) Check coin switch connections to the logic board; make sure the coin switch is wired correctly.
  - b) Check U12, pins 3 and 11 for a pulse each time the coin switch is activated. Also, check U11 and U13.
  - c) Check also for the 4 msec. pulses at pin 7 of U10. These pulses serve as timing for the video circuit. Check also pin 5 of U11; pin 6, U13.
  - d) If a game is started only occasionally when a coin is deposited, the coin switch wire may need to be adjusted for a lighter, or heavier, tension.
  - e) If the coin counter does not activate, check U12, pin 3 for a pulse each time the coin switch is activated; also, check Q1 and Q2. (see sheet 5)
4. No  $\emptyset$ 1 clock pulses to the microprocessor: (see sheet 4)
  - a) check for pulses at the crystal, Y1.
  - b) check for pulses at pin 6 of U68; at pin 6 of U49; and at pin 4 of U54.
5. No player control: (see sheet 5)
  - a) make sure the player control connections from the switches to the

## MAINTENANCE PROCEDURES- cont'd.

logic board are intact. Ensure that each switch is connected.

- b) If these are good, check for an output from U1 as you push each switch.

### 6. Random display on the screen:

- a) If the screen shows what appears to be a meaningless display, and it cannot be cleared by activating the coin switch, several different parts of the circuit should be considered:

One or more RAM's, U56 through U63 (sheet 5)

One of the programmed IC's, or EPROM's (sheet 6) Check their sockets.

The reset circuit is not working. (see #1, above)

The microprocessor is bad. (sheet 4)

Data or address bus problem (e.g. U33 or U34, sheet 4, could be bad)

## TRANSFORMER VOLTAGE CONVERSION INSTRUCTIONS:

To convert the game transformer to 100, 115, or 230 VAC, refer to the following chart:

For 100 Volts: Connect the voltage INPUT lines to terminals 1 and 2 on the transformer.

For 115 Volts: Connect the voltage INPUT lines to terminals 1 and 3.

For 230 Volts: Connect the voltage INPUT lines to terminals 1 and 4, with terminal 3 connected to the LAMP circuit.

Also, the TV monitor must be converted to the same voltage input as the game transformer. Refer to the monitor manual included in the game.
